SPECIFICATION AMENDMENTS

On page 6, replace the second paragraph beginning on line 18, with the following

replacement paragraph:

As an alternative to the foregoing, the invention could be implemented without using the

Internet call waiting service customer database of the intelligent network resource 26. In that

case, when the intelligent network ~~resource 27~~ resource 26 receives a call alert service request

from the voice network resource 4, the Service Node software 27 will simply bypass the usual

query of its Internet call waiting customer database, performing neither billing verification nor

subscriber verification.
